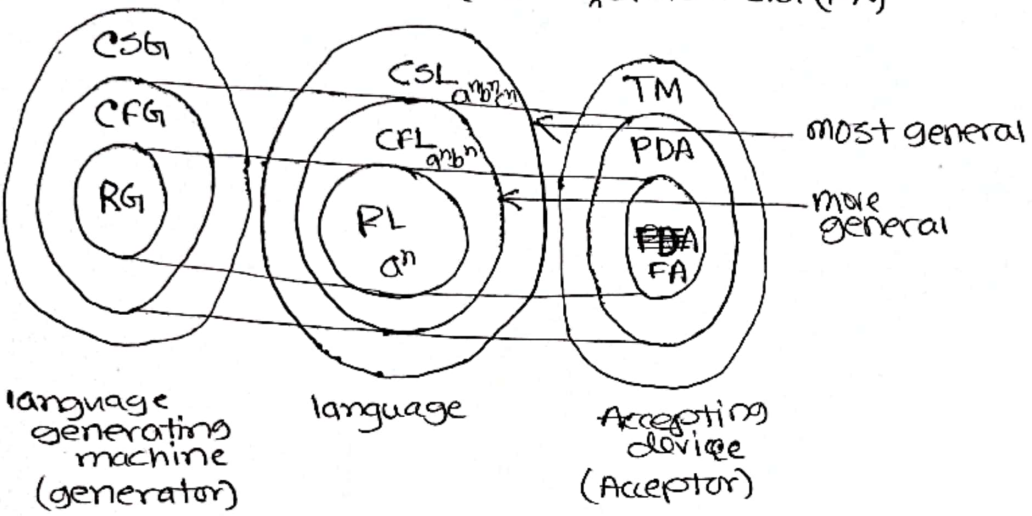
Date: 29.10.2024

Finite automata:

language → machine/device → grammer.

* All solvable problems are identified as context sensitive language → Turing machine দ্বারা use.

- context sensitive language (CSL) → Turing machine (TM) যে machine দ্বারা
- context free language (CFL) → pushdown automata (PDA)
- Regular language (RL) → finite automata (FA)



- a^n → RL
- $(abc)^n$ → RL
- $a^n (bc)^n$ → CFL
- $(ab)^n c^n$ → CFL
- $a^n b^n c^n$ → CSL.

- **RL:** $L = \{\varepsilon, 0, 00, 000, \ldots\}$ (ε ← empty)

$L = \{0^n \mid n \geq 0\}$

$L = \{a^n \mid n \geq 0\}$

n → length of zero.

$0^1 = 0$, $0^2 = 00$, $0^0 = \text{empty}(\varepsilon)$

regular language → memory থাকে না। (compare হচ্ছে না এইজন্য) ← সব language accepted হচ্ছে না।

- **Finite automata:** (building block of finite automata is symbol)
  - **Symbols:** building block : 0, 1 ..., a ... z, A ... Z.
  - **Alphabet:** finite set of symbols.

    Binary alphabet. $\Sigma = \{0, 1\}$

    English alphabet. $\Sigma = \{a \ldots z, A \ldots Z\}$

    Decimal alphabet. $\Sigma = \{0, \ldots 9\}$.
  - **String:** Sequence of symbols over an alphabet:

    0, 00, 01, 10, 010, 1000001 ...
  - **language:** set of strings / collection of strings over an alphabet finitely or infinitely.

    $L_1 = \{$set of all strings of length '2' over $\Sigma = \{0,1\}\}$

    $= \{00, 01, 10, 11\}$ → Finite language.

L_2 = {set of all strings starting with '0' over $\Sigma = \{0,1\}$}

= {0, 00, 01, 011, ...} ← Infinite language ⇒ finite representation:

- FSM: Finite state machine
- FSA: Finite state automata.

$\Sigma = \{a \cdots z, A \cdots Z\}$ a/A → symbol and word

a^n

$\Sigma = \{a \cdots z, A \cdots Z, \_\}$

$\Sigma = \{a \cdots z, A \cdots Z, \_, \square\}$ ← space

$a^n b^n$

$\Sigma = \{a \cdots z, A \cdots Z, \_, \square, \backslash n\}$ $a^n b^n c^n$

- $L = \{a, b\}$

$L = L^0 \cup L^1 \cup L^2 \cdots = \Sigma^0 \cup \Sigma^1 \cup \Sigma^2 \cdots$

$= \{\varepsilon\} \cup \{a, b\} \cup \{aa, bb, ab, ba\} \cup \cdots$

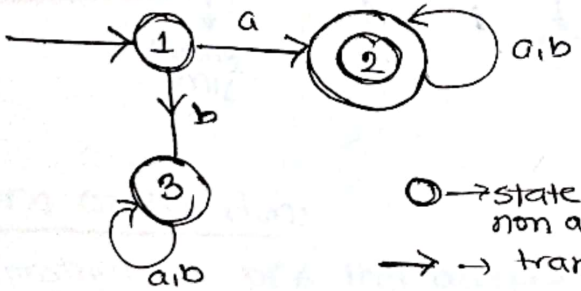
$L = \{\varepsilon, a, b, aa, ab, ba, bb, \cdots\}$

* More specific: (Starting with a)

* $L_1 = \{a, aa, ab, aaa, aba, abb \cdots\}$

⇓ finite representation (finite automata) → 3 ভাবে বলা যায়:

① Pictorial form (Transition diagram)



○ → state / non accepting state

→ → transition

→○ → starting state

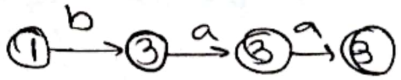
◎ → final/accepting state.

for aab

Transition diagram →

- fully consumed.
- whole length পড়া হবার পর final stage/state এ থাকে → ঐ language এ → accepted.

for baa



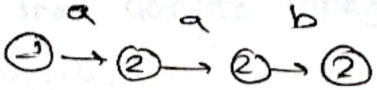
- finite state এ যায়নি fully consumed হবার পর → rejected → ঐ language এর কেউ না।

② Tabular form:

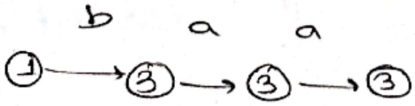
State	a	b
start → 1	2	3
final * 2	2	2
3	3	3

← Transition table:

Transition diagram:



(accepted in that language)



(rejected in that language)

(iii) Mathematical / Math model form:

Finite automata (FA) is a 5-tupple.

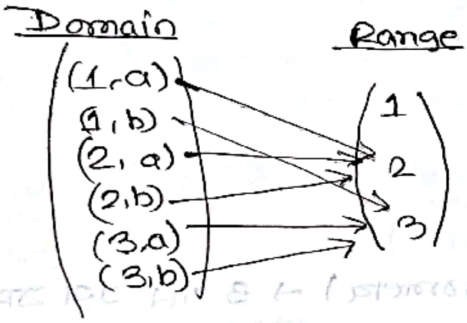
machine: $M = (Q, \Sigma, \delta, q_0, F)$

$Q \rightarrow$ finite set of states
$\Sigma \rightarrow$ finite set of symbols. (alphabet)
$\delta \rightarrow$ is a mapping function, (delta)
$q_0 \rightarrow$ starting state
$F \rightarrow$ final state.

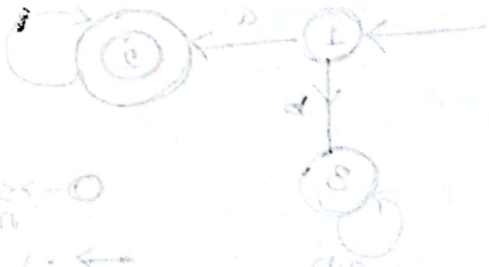
$Q = \{1, 2, 3\}$
$\Sigma = \{a, b\}$
$q_0 = 1.$
$F = 2$

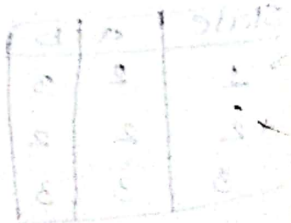
$\delta : Q \times \Sigma \longrightarrow Q.$
Domain range.

$\therefore \{1,2,3\} \times \{a,b\} = \{(1,a), (1,b), (2,a), (2,b), (3,a), (3,b)\}$



$\therefore \delta(1,a) = 2$
$\delta(1,b) = 2$
$\delta(2,a) = 2$
$\delta(2,b) = 2$
$\delta(3,a) = 3$
$\delta(3,b) = 3.$





Date: 11.11.2024

→ Construct a FA/FSA/FSM that accept language of all strings starting with 'a' over $\Sigma = \{a, b\}$.

⇒ $L = \{a, aa, ab, \ldots\}$

3. $M(L) = (Q, \Sigma, \delta, q_0, F)$

$Q = \{P, Q, D\}$

$\Sigma = \{a, b\}$

$q_0 = P$

$F = \{Q\}$

$\delta: Q \times \Sigma \to Q$.

$(P, a) = Q$ $(P, b) = D$

$(Q, a) = Q$ $(Q, b) = Q$

$(D, a) = D$ $(D, b) = D$

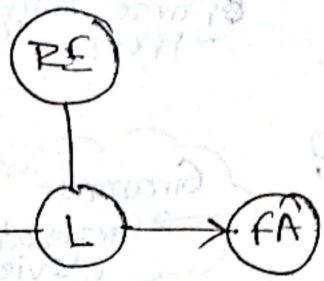
moor m/c.

* mele m/c এ input N output M হলে,

moor m/c এ সর্বোচ্চ output হবে N×M.



Grammer is represented by 4 tuple.

$G_1 = (N, T, S, S)$

N → set of non terminal
T → set of terminals.
S → starting symbol, $S \in N$.
S → set of productions/ productions rules/ rules.

(i) $S \rightarrow aSB \mid aB$ (ii)

(ii) $B \rightarrow b$

N = {S, B}
T = {a, b}
S = { }
S = S.

Capital letters ↳ variable.

$L(G) = \{a^n b^n \mid n \geq 1\}$

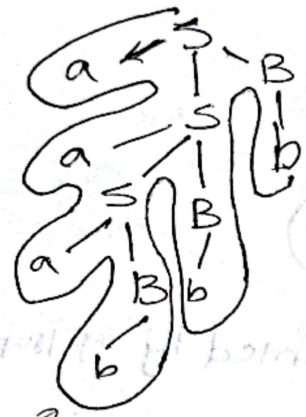
Getting strings from the grammer is called derivation.

$S \Rightarrow aSB$ [using (i)] $w = "aaabbb"$
$\Rightarrow aaSBB$ [using (i)]
$\Rightarrow aaaBBB$ [using (ii)]
$\Rightarrow aaabBB$ [using (iii)]
$\Rightarrow aaabbB$ "
$\Rightarrow aaabbb$ " → sentence.

sentential forms

← LMD
Left most Derivation
RMD ↓ opposite

Pictorial form → Derivation (TOC) tree / Sparse tree (compile design)



traverse.

Grammer → Generating device.

$L = \{a^m b^m\}$

* How to create G from RL:

$L = \{aa, ab, ba, bb\}$

$S \to aa|ab|ba|bb.$

$RE = aa + ab + ba + bb.$

$= a(a+b) + b(a+b).$

$= \underbrace{(a+b)}_{A}\underbrace{(a+b)}_{A}.$

$S \to AA$

$A = a/b.$

$S \to aA|bA.$

$A \to a|b.$

$\Sigma = \{a, b\}.$

exactly (2)

at least 2).

$L = \{aa, ab, ba, bb, \ldots\}$

~~$S \to aS +$~~ $a(a+b) + b(a+b)$

$(a+b)(a+b)(a+b)^*$

$S \to AAB$

$A \to a|b.$

$B \to aB|bB|\varepsilon$

$S \to aS|bS|\varepsilon.$

$a(a+b)^*b$

$S \to aBb.$

$B \to aB|bB|\varepsilon.$

ending with.

different symbol

$a(a+b)^*b + b(a+b)^*a$

$S \to aBb|bBa.$

$B \to aB|bB|\varepsilon.$

RL থেকে যে যে মেশিন দ্বারা recognize করা যায় FA দ্বারা।

memoryless device

$a^m b^m \to$ memory লাগে. FA হবে না,

$a^m b^m \to$ FA হবে।

Classification of Grammar:

Noam Chomsky classify grammer in four categories; based on different restrictions:

1. Unrestricted G_1.
2. Context sensitive G_1. (CSG)
3. " Free G_1. (CFG)
4. Regular G_1. (RG)

(2, 3, 4 — restricted)

* CSG:

$\alpha \rightarrow \beta$;

α is defined as

$\varphi_1 A \varphi_2$

β is defined as

$\varphi_1 \tau \varphi_2$

$\varphi_1, \varphi_2 \in (N \cup T)^*$ (context)

$A \in N$

$\tau \in (N \cup T)^+$

A can be rewrite as τ in the context of φ_1 and φ_2,

$\varphi_1 A \varphi_2 \rightarrow \varphi_1 \tau \varphi_2$

$\alpha \rightarrow \beta$; $|\alpha| \leq |\beta|$.

Date: 07.12.2025

* Chomsky classification/Chomsky Hierarchy of Formal Grammer:

$L(G) = \{a^n b^n c^n \mid n \geq 1\}$.

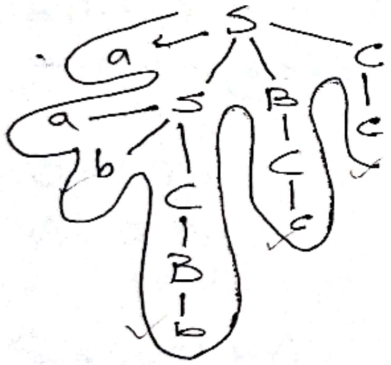
1. $S \rightarrow aSBC$.
2. $S \rightarrow abC$.
3. $bB \rightarrow bb$
4. $bc \rightarrow bc$
5. $CB \rightarrow BC$
6. $cC \rightarrow cc$

→ restriction যেমন সবচেয়ে কম: ডানে কম বামের terminal থাকে

restriction ↓, general (most) ↑

Context sensitive → most general

$w =$ "aabbcc". $n = 2$.



aabbcc

CFG: (Context free grammar)

Restriction: CSG এর (চেয়ে বেশি) production রুলে যেমন বিদ্যমান,

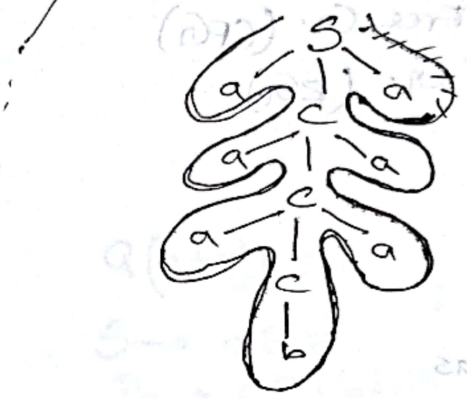
$\alpha \rightarrow \beta$

$\alpha \in N$. (Non-terminal)

$L(G) = \{a^n b a^n \mid n \geq 1\}$

1. $S \rightarrow aCa$
2. $C \rightarrow aCa$
3. $C \rightarrow b$.

$w =$ "aaabaaa"



* Regular grammer - G of G.

Regular Grammer (RG):

(সবচেয়ে বেশি restrict...)

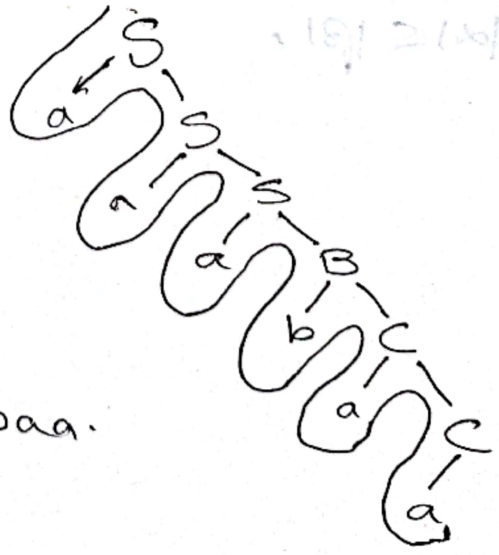
$\alpha \rightarrow \beta$

$\alpha \in N$, β is the form of aB or a, where $a \in T$, $B \in N$.

$L(G) = \{a^m b a^n \mid n, m \geq 1\}$.

1. $S \rightarrow aS$
2. $S \rightarrow aB$
3. $B \rightarrow bC$
4. $C \rightarrow aC$.
5. $C \rightarrow a$.

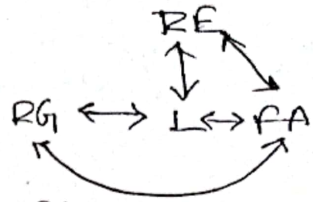
$w =$ "aaabaa"



aaabaa.

RG

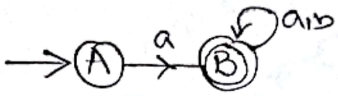
- LLG (Left linear Grammer)
  - *Left দিকে expand করে
  - *B will be form of a or Ba
- RLG (Right linear Grammer)
  - *Right এ expand করে
  - *B will be form of a or aB



RG ⟷ FA:

A → aB.
B → aB|bB|ε

*variable গুলো state হবে।



* ε থাকলে হলে end state এ আসতে rules violet করবে।

G

- UG (T_1)
- RG
  - CSG (T_2)
  - CFG (T_3)
  - ReG (T_4)
    - LLG
    - RLG.

$L(T_1) \supseteq L(T_2) \supseteq L(T_3) \supseteq L(T_4)$

most general . . . . most restricted

* RLG vs LLG.

RLG:

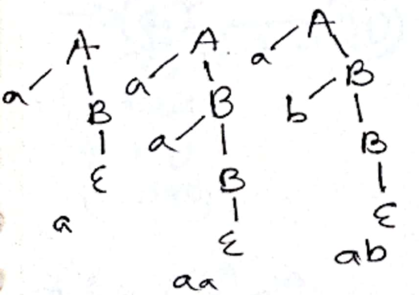
A → aB

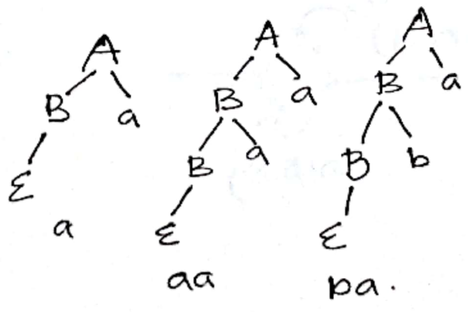
B → aB|bB|ε

LLG:

A → Ba

B → Ba|Bb|ε.





L = {a, aa, ab, ...}
starting with a.

L = {a, aa, ba ...}
ending with a.

* RLG থেকে direct conversion করলে language change হয়ে যাবে।

∴ RLG and LLG is not equivalent; conversion করতে হবে।

* RLG, LLG conversion:

1. RLG → FA
2. FA কে reverse করে new FA.
3. FA → RLG.

   B → aB|bB|aA

   A → ε

4. RLG কে reverse করে LLG.

   B → Ba|Bb|Aa

   A → ε.

* $L = \{a^n b^{2n} \mid n \geq 1\}$

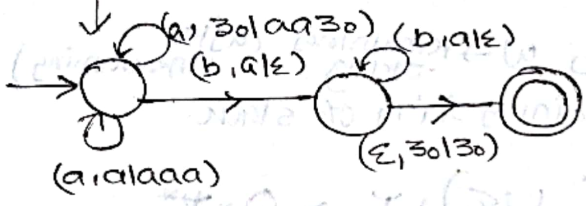
aabbbb

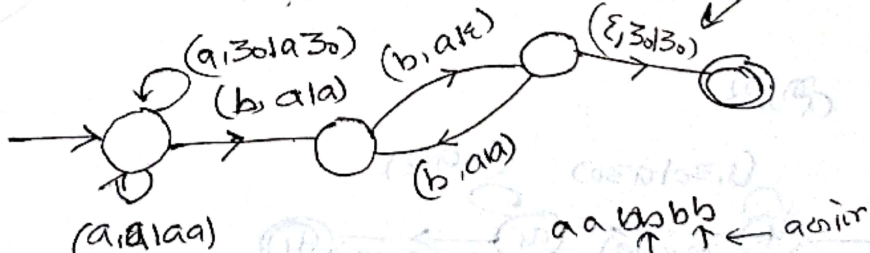
একটা a এর জন্য দুইবার a push হয়

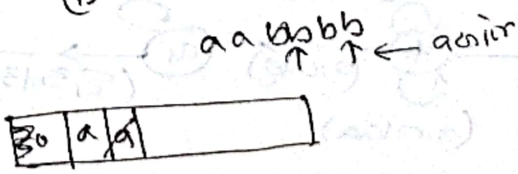
একটি করে a রাখলাম।

↳ first a কে ignore করলাম.

and b এর জন্য একটি করে a pop করলাম।

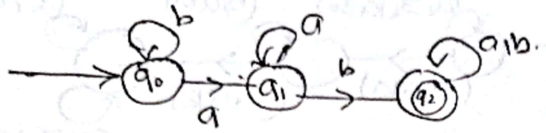




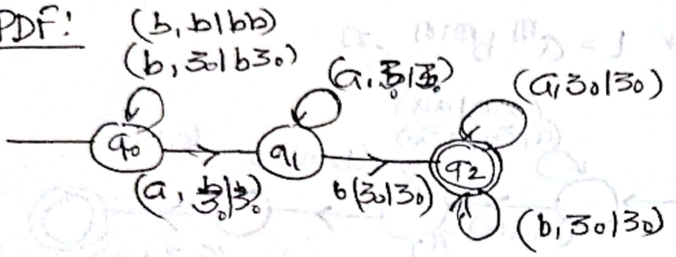


{ab, aab, aba, bab, ...} ← containing ab

DFA:



PDF:



Instantaneous Description: (ID):

ID is a formal notation of how a PDA computes strings and makes a decision whether the string is accepted or rejected.

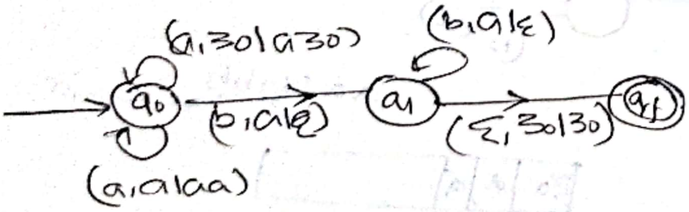
Triple (q, ω, α)

$q \rightarrow$ state, $\omega \rightarrow$ remaining string (after consumming)

$\alpha \rightarrow$ remaining string of stack.

$\delta : Q \times (\Sigma \cup \epsilon) \times \Gamma \rightarrow Q \times \Gamma^{*}$

$a^n b^n$



$(q_0, a, z_0) = (q_0, az_0)$

$(q_0, a, a) = (q_0, aa)$

$(q_0, b, a) = (q_0, az_0)$

$(q_1, b, a) = (q_1, z_0)$

$(q_1, \epsilon, z_0) = (q_f, z_0)$

(accepted)

$(q_0, aabbz_0) \Rightarrow (q_0, abb, az_0) \Rightarrow$

$(q_0, bb, aaz_0) \Rightarrow (q_1, b, az_0) \Rightarrow$

$(q_1, \epsilon, z_0) \Rightarrow (q_f, \epsilon, z_0)$

$L = \{a^n b^n c^n \mid n \geq 1\}$

$n = 2$
